

## Assignment #1: Classical Ciphers

**Deadline: Sept 12, 11:59 PM, 2019.**

Total: 100

All written assignments should be created using a word processor (e.g., Word or Latex). Hand-written work will not be accepted.

All students should submit a pdf file of their answers through Canvas. Be sure to name the file as follows: HW1\_LastName\_FirstName.pdf. For example, if a student's name is John Doe, then he would name the file as HW1\_John\_Doe.pdf. Also, submit the source code (including any header files that you may have used) to Canvas. Name the file as: HW1code\_LastName\_FirstName.fileExtension (e.g., HW1code\_John\_Doe.cpp).

Zip up all files **into one zip** file and submit it to Canvas.

1. The objective of this problem is to learn about monoalphabetic substitution ciphers and to use letter frequencies to cryptanalyze a given ciphertext.

Write a program (in any programming language) to analyze the letter frequencies in a block of text. Ignore case (upper and lower count the same). It should count the number of times each letter appears in the text, the number of times each pair of letters appears, and the number of times each sequence of 3 letters appears. Your program should sort the counts of single letters, pairs of letters (bigrams), and triples of letters (trigrams), then print the non-zero values in decreasing order. For single letters, print all non-zero values; for bigrams and trigrams, print the first 30 non-zero values.

Turn in the following items by the deadline.

- (a) (50 pts) As instructed above, submit a soft copy of your program via Canvas. Please write your own program! Do not copy other peoples' programs.
- (b) (25 pts) Output of your program run against at least 2 different texts of sufficient length. Make sure that the texts are sufficiently long enough for frequency analysis.
- (c) (5 pts) Compare the 2 sets of frequencies you produced for part (b). Are they similar or different? Explain why they are similar or different.
- (d) (20 pts) Using your frequency analysis results, decrypt the ciphertext given below.

For part (b), you can run your program on texts found on the Internet. For example, you can find the full text for Hamlet online (<http://www.bibliomania.com/0/6/3/1057/frameset.html>).

Ciphertext for (d):
